

Often ill Children in Russia

Dmitrieva Elena Germanovna

Clinical Pharmacist, Charity Pharmaceutical Clinic Russia, Russia

I trace a problem of often ill children since 1983. Then to pregnant women put inoculations from a mastitis – imparted staphylococcal anatoxine – during the second trimester of pregnancy – 3 inoculations under a shovel. After that the generation of often ill children was born. The problem came to light on accruing – after a birth appeared vesiculopustules, then exsudative a diathesis, further – a neurodermatitis, and then – an infection *Staphylococcus aureus* with neurologic complications. All it is fixed by me. It is not surprising, that this generation has given another marginal generation of often ill children. I have found original causes in inoculations. If the natural smallpox took root meaningly on hips that the person other inoculations became from paralogic thinking has not been disfigured. Only something to do. What is for? This cogitative activity missed.

METHODS AND THE ANALYSIS OF RESEARCHES

I survey many children at the age from 0 to 6 years. All of them were vaccinated as I them name. If during soviet time did only three inoculations, as now do 16 inoculations till 3 years when there is a formation of own immunity. To 2020, quantity of vaccines increases to 20. I consider, that this disgrace, instead of care of children.

Methods immunological were applied in the Federal center of motherhood and the childhood in of Ivanovo. Defined immunogramms the first level of complexity. These methods revealed the lowered level – Ig A including secretor Ig A (more low 0.8), and also increase of level Ig G (above 0.17), that says that in an organism of children there is an infection. Probably, what not one. Thus, there is a syndrome of strengthening of an infection – on one infection always there is a stratification of other infections. Here to you and often ill children. Besides, a syndrome imprinting's – it is impossible to define level of antibodies, it turns out, that results of vaccines become unknown, though, pours out then – late by-effects from vaccines – late post-vaccinal syndromes from vaccines. They are doctors do not consider absolutely. I observed at already young age a considerable quantity of young men, more often women with a multiple sclerosis, and men – with amyotrophic a lateral sclerosis. There are at me such researches. Early post-vaccinal syndromes too not all doctors see, more often, other diagnosis though; it is visible, that it from vaccines is written absolutely. I had in practice an awful case when the child had a fever (sub fever – 37, 5–38, 0) more than 1 year, has ceased to talk, after all under analyses all inoculations and their concentration sit in a brain and can destroy it. Nobody wishes to investigate it. Has painted treatment, but doctors have waved away from me. Paralogic thinking,

to badly child, instead of whether to make to it one more inoculation?!

Inoculations polyvalent are especially terrible, on them antibodies often are not formed at all, and collateral reactions to much componential inoculations much more.

Why pediatres and school doctors deduce from group of children which are not imparted? That have not caught from other imparted children. If all are pure from inoculations infections will be less. Less. It is an axiom.

The vaccines tested on children in VOLGOGRAD have indeed already been approved and are now in direct sales!!!

And volgograd women are left alone with sick children

The main character of the famous vaccine scandal in Volgograd, where for big American money under the personal patronage of the wife of the chief pediatrician of Russia Alexander Baranov, Leila, was lit up Seymurovna Namazova-Baranova, now Director of the research Institute of preventive medicine pediatrics and rehabilitation treatment of the NCD RAMS, illegal trials of glaxo smith kline – made vaccines against measles, mumps, and rubella in combination with the varicella vaccine were conducted. Several children who were given these vaccines were disabled as a result of the tests. Only after the intervention of the Prosecutor's office, these tests were stopped, and the main performers of the tests in Russian cities, spitting on high-yield grandees, began to urgently retire.

By a strange coincidence circumstances, Leila's Samurovi Baranova-Namazova now serving a well-deserved punishment, but on the contrary, he heads a large Russian vaccination center and actively participates in lobbying for new vaccines against hemophilic infection, chickenpox and pneumococcus. Hence, with its active participation in Russian calendar in 2011, a new vaccine against Hemophilus coli was introduced. The same one that is part of the pentaxime vaccine, which in Ukraine only in 2009-2010, according to various sources, claimed the lives of more than 20 children.

An interesting approach to the business of Mrs. Leyla Seymurovna Baranova-Namazova: together with her husband, chief pediatrician of Russia Alexander Baranov, she has repeatedly stated that all vaccinations are safe and shown to everyone that contraindications to vaccinations are reduced to a minimum. But with all this, they do not forget to advertise their commercial center, where vaccinations are not safe and paid. It seems that all this PR hype with a new vaccine against *Haemophilus Bacilli* in the Russian calendar is started specifically for advertising their center. It is

significant that first she gets a lot of money for illegal testing of a chicken pox vaccine, and then lobbies for its inclusion in the Russian national calendar.

It seems that in Russia there is a well-paid and cohesive lobby, which includes representatives of the Union of pediatricians of Russia Leila.

Namazova-Baranova, Alexander Baranov, Vladimir Tatchenko, Gennady Onishchenko, Pavel Astakhov, and T. V. Yakovleva, who to promote the Russian market of foreign manufacturers of vaccines Pfizer and Glaxosmitkline, are ready to destroy their own children for money in their pockets.

It is clear that illegal testing of foreign vaccines on Russian children (e.g., in Volgograd) is supervised by people who then promote these vaccines to the Russian market. First of all, this is Leila Baranova-Namazova. The media are a four-digit amount in euros, which she received for illegal testing of vaccines of GlaxoSmithKline in the company Volgograd. At the same time, parents of children who suffered from illegal tests did not receive a penny for participating in the experiment. All the money went to the program Manager (author's note).

TREATMENT VACCINED CHILDREN

This general scheme. But each organism to treat it is necessary individually

1. Immunomodulators – Imunofan, Derinat, but they should be selected for each clinical situation separately. However, these preparations dangerous enough to an organism of children. There can be very strong reaction to their introduction that hospitalization and detoxication is required.
2. I describe level ling of inoculation in article about tuberculosis. It should be on the Internet. Though, I know, that this inoculation the very first and the most terrible for any child. It shifts immunity downward that many do not maintain, after all develops not finished fagocytos. Thereby, doctors deprive of children of protection against any infection.
3. Personally I appoint biological products – stabilizing intestinal flora (hilak-forte, acipol, and other preparations bifidobacterium). It does more protected from respiratory infections.
4. I use vegetative Immunomodulators – Echinacea and others.
5. The etiotypical treatment of infections – we do the analysis on nonspecific microflora to learn the infectious agent, to influence it. Then decrease Ig G. Thereby the infection or infections is cleaned. Sometimes it is necessary to do some courses of treatment to destroy this or that infection.

CONCLUSIONS

1. The community of clinical pharmacists should interfere and stop destruction of health of children and limit vaccination till 3 years when there is a formation of own immunity
2. It is necessary to introduce everywhere differential diagnostics yatropatii (poisonings from medicines, vaccines, whey and toxicants) in standards of diagnostics for clinical pharmacists. Doctors of it do not know, unfortunately
3. Only from three flight age and only at will of parents it is possible to do inoculations on an epidemiological situation
4. I have been compelled to observe, how infections from inoculations develop. From it suffers to 2% of imparted children, but these are millions if to take all population for 100% of children. Moreover, it not only collateral reactions, but is a lot of death in a dream – a syndrome dyspnea a dream at children from respirator distress's from inoculations
5. I am ready to describe new methods of treatment of children's infections without vaccines, at the same time and collateral

action of vaccines to describe differential diagnostics yatropatii (poisonings) if there will be a financing

6. It is necessary to rise on protection of children Clinically to Pharmacists of Europe and the world
7. To develop alternative methods of treatment of children's illnesses, they at me many are developed. It is necessary to describe only them and to introduce clinical practice. This right of children and their parents.

The note: Now at me is not present in staff of the mathematician-statistician; therefore, there is no possibility to shorthand statistical methods. However, the analysis of tendencies is visible and without it. For this reason I write clinical articles though, the same groups of patients undertake and the analysis of their state of health and parameters of researches in dynamics is conducted.
